Project Title

HAYAT: Building a National Organ Donation and Transplant Coordination Ecosystem

Project Brief

HAYAT, the UAE National Program for Organ and Tissue Donation and Transplantation, represents one of the most significant healthcare transformations undertaken in the United Arab Emirates. Established under the leadership of the Ministry of Health and Prevention (MOHAP) and implemented in collaboration with federal and local health authorities, healthcare institutions, transplant centers, laboratories, and community stakeholders, HAYAT transformed organ donation and transplantation from a fragmented healthcare service into a nationally coordinated, patient-centered ecosystem.

The program's most innovative achievement is the establishment of the HAYAT National Organ Donation and Transplant Coordination Ecosystem, a first-of-its-kind model in the region that integrates governance, legislation, clinical pathways, operational processes, stakeholder collaboration, information exchange, quality management, and public engagement into a unified national framework. Rather than focusing solely on transplantation activity, HAYAT redesigned the entire donation and transplantation.

The ecosystem aligns donor hospitals, transplant centers, histocompatibility laboratories, organ donor hospitals services, regulatory authorities, healthcare professionals, and community partners through standardized clinical pathways, transparent allocation mechanisms, and coordinated governance structures. This integration enables real-time operational coordination, equitable access to transplantation services, accountability, and evidence-based decision-making across the country.

Beyond operational excellence, HAYAT introduced a transformative legislative and ethical framework that guarantees fair organ allocation based on medical need, irrespective of nationality, religion, gender, ethnicity, or socioeconomic status. This approach strengthened public confidence, enhanced transparency, and established organ donation as a shared humanitarian responsibility.

The impact has been substantial. The UAE’s real organ donor rate increased more than tenfold between 2020 and 2025, rising from 0.9 to 14 donors per million population., Thousands of patients have benefited from life-saving transplants, and the program has facilitated collaboration across more than 53 nationalities, demonstrating the ability of a multicultural society to unite around a common humanitarian mission.

Today, HAYAT is internationally recognized as one of the fastest-growing organ donation and transplantation programs globally. The program demonstrates how integrated governance, stakeholder alignment, health system modernization, community engagement, and clinical excellence can create a sustainable and scalable model capable of saving lives, strengthening healthcare systems, and establishing a new international benchmark for organ donation and transplantation.

Background

Prior to the establishment of HAYAT, organ donation and transplantation services in the United Arab Emirates faced challenges commonly associated with emerging transplantation systems. Donation activities were limited, coordination among healthcare stakeholders was fragmented, and transplantation services operated primarily within individual institutions rather than through a unified national framework. Consequently, patients suffering from end-stage organ failure often experienced limited access to transplantation opportunities, prolonged waiting periods, or reliance on treatment abroad.

At the same time, the UAE was witnessing rapid population growth and increasing healthcare demands driven by chronic diseases such as diabetes, hypertension, cardiovascular disease, and chronic kidney disease. These conditions significantly increased the number of patients requiring organ transplantation as a life-saving intervention. The UAE's diverse population, representing more than 200 nationalities, further emphasized the need for a transparent, equitable, and nationally coordinated system that could ensure fair access to transplantation services regardless of nationality, religion, ethnicity, gender, or socioeconomic status.

The challenge extended beyond clinical care. Organ donation and transplantation involve a highly complex ecosystem requiring seamless coordination among healthcare providers, regulatory authorities, laboratories, donor hospitals, transplant centers, emergency and critical care services, community organizations, and families. The absence of a unified governance and operational framework limited efficiency, reduced donation opportunities, and constrained the development of a sustainable national transplantation program.

Recognizing these challenges, the Ministry of Health and Prevention launched HAYAT as a comprehensive national transformation initiative rather than a conventional healthcare program. The initiative aimed to establish an integrated ecosystem that aligns legislation, governance, clinical excellence, stakeholder collaboration, public awareness, workforce development, and digital innovation within a single national model.

HAYAT was designed not only to increase transplantation activity, but also to save lives, improve quality of life, strengthen public trust, promote social solidarity, and support the UAE's vision for healthcare excellence.

Objective

The overarching objective of HAYAT was to establish a sustainable, equitable, and nationally integrated organ donation and transplantation ecosystem capable of delivering life-saving healthcare services while supporting the long-term sustainability of the UAE healthcare system.

The program was designed to increase organ availability by strengthening donor identification, enhancing donation opportunities, promoting a culture of donation,

and encouraging community participation through education, awareness, and public engagement initiatives.

A key objective was the establishment of a unified national coordination framework connecting donor hospitals, transplant centers, laboratories, organ procurement services, health authorities, and community partners. Through standardized clinical pathways, coordinated governance structures, and integrated information management, the program sought to improve donor identification, facilitate transparent organ allocation, optimize operational coordination, and support continuity of care across the transplantation journey.

Another fundamental objective was to ensure equitable access to transplantation services. HAYAT was designed to guarantee that organs are allocated according to medical urgency, compatibility, and patient need, without discrimination based on nationality, gender, religion, ethnicity, or financial status.

The program also aimed to strengthen national governance, establish world-class clinical standards, support workforce development, and align transplantation practices with international best practices. Through strategic partnerships, knowledge exchange, and collaboration with leading international organizations..

Implementation

Implementation Strategy

The implementation of HAYAT was conceived as a national transformation initiative aimed at redesigning the entire organ donation and transplantation pathway within the United Arab Emirates. Recognizing that successful transplantation systems require more than clinical excellence alone, the program adopted a comprehensive approach integrating governance, legislation, healthcare operations, stakeholder collaboration, workforce development, public engagement, and information-enabled decision-making into a unified national ecosystem.

The implementation followed a phased and scalable strategy designed to ensure sustainability, stakeholder ownership, and long-term impact.

Phase 1: National Assessment and Strategic Design

The first phase focused on conducting a comprehensive assessment of the national organ donation and transplantation landscape. Existing donation and transplantation practices, operational challenges, healthcare capabilities, and regulatory frameworks were evaluated against international best practices from leading transplantation systems including Spain, the United States, the United Kingdom, and other advanced jurisdictions.

This assessment identified critical opportunities to improve donor identification, stakeholder coordination, public engagement, governance, and transplantation capacity. Based on these findings, a national strategy was developed defining the vision, objectives, governance structure, performance indicators, and implementation roadmap required to establish a sustainable transplantation ecosystem.

Phase 2: Governance and Legislative Transformation

Recognizing that public trust and sustainability depend on strong governance, the second phase focused on establishing a robust regulatory and ethical framework.

National legislation, policies, standards, and operational procedures were developed to regulate donor identification, determination of death, donor authorization, organ allocation, transplantation practices, quality assurance, and stakeholder responsibilities. The governance framework established clear accountability mechanisms while ensuring alignment with international ethical principles and best practices.

A key innovation was the creation of a nationally coordinated allocation system that guarantees equitable access to transplantation services and allocates organs according to medical need, independent of nationality, religion, ethnicity, gender, or socioeconomic status.

Phase 3: Establishment of the National Organ Donation and Transplant Coordination System

A major milestone in the implementation journey was the creation of the HAYAT National Organ Donation and Transplant Coordination System.

Rather than functioning solely as a clinical database, the system was designed as a national coordination framework that integrates donor hospitals, transplant centers, laboratories, organ procurement services, regulatory authorities, and healthcare professionals through standardized pathways and interoperable information exchange mechanisms.

The system supports the complete transplantation continuum, including:

• Donor identification and referral

• Donor evaluation and suitability assessment

• Family support and authorization processes

• Waiting-list management

• Organ matching and allocation

• Organ recovery and transportation

• Transplantation procedures

• Recipient follow-up and outcome monitoring

• Quality assurance and performance measurement

This integrated approach significantly improved operational coordination, transparency, traceability, patient safety, and accountability throughout the donation and transplantation process.

Phase 4: Clinical Integration and Workforce Development

Successful implementation required strengthening national clinical capabilities and ensuring consistent practice across participating institutions.

Standardized clinical pathways, donor management protocols, allocation procedures, and transplantation standards were implemented nationally. Extensive workforce development initiatives were conducted for intensivists, emergency physicians, neurologists, transplant professionals, nurses, donor coordinators, laboratory specialists, and healthcare administrators.

International collaborations facilitated knowledge transfer and supported the development of national expertise in donor management, transplantation medicine, quality assurance, and program leadership.

Phase 5: Community Engagement and Culture Change

A sustainable organ donation and transplantation system requires public confidence and societal participation. Therefore, a comprehensive engagement strategy was implemented to promote organ donation as a humanitarian act and shared societal responsibility.

National awareness initiatives, educational programs, community initiatives, media engagement, and partnerships with religious leaders, educational institutions, charitable organizations, and government entities were established to increase awareness and address misconceptions.

These initiatives contributed to the development of a national culture of donation while strengthening public trust in the transplantation system.

Phase 6: Continuous Improvement and International Collaboration

The final phase focused on sustainability and continuous improvement.

Performance monitoring systems were established to evaluate donation activity, transplantation outcomes, stakeholder engagement, operational performance, and patient outcomes. Continuous benchmarking against international standards ensured that the program remained aligned with global best practices.

Strategic collaborations with leading transplantation organizations facilitated innovation, capacity building, and international knowledge exchange, positioning the UAE as an active contributor to the global transplantation community.

Barriers and Solutions

The implementation of HAYAT required overcoming challenges across societal, operational, regulatory, and organizational domains.

Limited Public Awareness

Many individuals lacked knowledge regarding organ donation and transplantation, while misconceptions and cultural concerns reduced participation.

Solution: Comprehensive national awareness initiatives, educational campaigns, and stakeholder engagement programs were implemented to build trust and improve public understanding.

Fragmented Stakeholder Coordination

Organ donation involves multiple healthcare institutions, authorities, laboratories, and clinical teams operating across different jurisdictions.

Solution: HAYAT established a unified national coordination ecosystem that aligned stakeholders through common governance structures, standardized pathways, and shared performance objectives.

Regulatory Complexity

The sensitive nature of organ donation required robust ethical and legal safeguards.

Solution: Comprehensive legislation, ethical standards, governance structures, and operational policies were introduced to ensure transparency, accountability, and public confidence.

Limited Transplantation Capacity

Expanding donation activity required specialized expertise and highly trained professionals.

Solution: National workforce development programs, international partnerships, specialized training, and capacity-building initiatives strengthened clinical capabilities across the country.

Information Fragmentation

Prior systems lacked the ability to support national coordination and performance monitoring.

Solution: The National Organ Donation and Transplant Coordination System created a unified framework for information exchange, operational management, quality assurance, and evidence-based decision-making.

Feasibility and Sustainability

The long-term feasibility of HAYAT is supported by strong governmental commitment, a mature governance framework, advanced healthcare infrastructure, and broad stakeholder ownership.

The program aligns directly with national healthcare priorities and contributes to healthcare sustainability by increasing access to transplantation services, reducing dependence on overseas treatment, and improving patient outcomes.

The ecosystem was intentionally designed to be scalable and adaptable, enabling future expansion to accommodate increasing transplantation activity, additional healthcare facilities, emerging technologies, and new clinical services.

By integrating governance, legislation, healthcare operations, workforce development, public engagement, and coordinated information management into a single national framework, HAYAT has established a sustainable and replicable model that can serve as a benchmark for transplantation systems regionally and internationally.

Result

HAYAT has successfully achieved its strategic objectives and transformed organ donation and transplantation into a nationally coordinated healthcare service that delivers measurable clinical, operational, societal, and humanitarian impact.

Saving Lives Through Increased Organ Donation

The program significantly increased donation and transplantation activity across the UAE.

In 2025 alone, the system managed more than 1100 potential donor referrals, facilitated over 400 family donation conversations, achieved 172 donor authorizations, and resulted in 158 actual deceased organ donors. These donors enabled 451 life-saving organ transplants for patients suffering from end-stage organ failure.

Since the establishment of the program, more than 500 deceased donors have contributed to saving lives through over 1500organ transplants.

Compared with the previous year, donation activity increased by 35.5%, while transplantation activity increased by 31%, demonstrating sustained growth and increasing national self-sufficiency.

Building a National Culture of Donation

One of HAYAT's most important achievements has been the enhancement of public attitudes toward organ donation.

Through sustained community engagement and awareness efforts, donor pledges have increased to more than 35000, reflecting growing public confidence in the program and increasing willingness to participate in organ donation. Notably, UAE nationals represent the second-largest group of pledges.

This cultural transformation represents one of the most sustainable outcomes of the initiative and provides a strong foundation for future growth.

Becoming One of the Fastest-Growing Donation Systems Worldwide

The UAE's deceased donor rate increased from 0.91 donors per million population in 2020 to 14 donors per million population in 2025, representing more than tenfold increase within only five years.

This remarkable growth positioned the UAE among the fastest-growing organ donation systems globally and established HAYAT as an internationally recognized example of successful health system transformation.

Advancing Equity and Inclusive Healthcare

HAYAT successfully implemented a nationally coordinated allocation system based on medical need.

Patients from more than 53 nationalities have benefited or contributed from donation and transplantation services through the program, demonstrating the UAE's commitment to equitable healthcare access and social inclusion.

The program strengthened public trust by ensuring transparency, fairness, and accountability throughout the allocation process.

Strengthening National Healthcare Sustainability

The establishment of a nationally integrated coordination ecosystem significantly improved operational efficiency, stakeholder collaboration, patient safety, and continuity of care.

Healthcare providers, transplant centers, laboratories, organ donation services, and health authorities now operate within a unified framework that supports coordinated decision-making and performance monitoring.

This integration reduced fragmentation, improved resource utilization, and strengthened the sustainability of transplantation services nationally.

Regional and International Impact

HAYAT facilitated the exchange of more than 500 organs with neighbouring countries and strengthened regional cooperation in transplantation.

The program established strategic partnerships with leading international organizations and contributed to the development of national transplantation standards across multiple organ programs.

These achievements positioned the UAE as an emerging regional leader and active contributor to global transplantation advancement.

Humanitarian Impact

Beyond healthcare metrics, HAYAT has transformed lives.

Thousands of patients have received a second chance at life, improved quality of life, and renewed opportunities to contribute to their families and communities.

The program demonstrates how healthcare innovation can generate measurable social value while advancing national priorities, strengthening healthcare sustainability, and promoting the values of compassion, solidarity, and human dignity.

Discussion and future directive

The HAYAT Program has demonstrated that organ donation and transplantation can be transformed from a highly specialized healthcare service into a nationally integrated ecosystem that delivers measurable clinical, societal, and humanitarian impact. Through the successful alignment of governance, legislation, clinical practice, stakeholder collaboration, public engagement, and coordinated information management, the program has established a sustainable framework capable of supporting long-term healthcare transformation.

The success of HAYAT validates the effectiveness of a systems-based approach to organ donation and transplantation. Rather than addressing individual components in isolation, the program integrated all elements of the organ donation and transplantation pathway into a unified national framework. This approach strengthened operational efficiency, enhanced transparency, improved accountability, increased public trust, and facilitated equitable access to transplantation services across the United Arab Emirates.

One of the most important lessons learned from the implementation of HAYAT is that sustainable growth in organ donation requires coordinated action across multiple sectors. Clinical excellence alone is insufficient to achieve transformational change. Success depends on the alignment of legislation, healthcare governance, workforce capabilities, public awareness, stakeholder engagement, ethical oversight, and operational coordination. By bringing these elements together within a single ecosystem, HAYAT created an environment capable of continuously generating donation opportunities and improving transplantation outcomes.

Despite the significant achievements realized to date, the demand for organs continues to exceed supply worldwide. The increasing prevalence of chronic diseases, including diabetes, cardiovascular disease, hypertension, and chronic kidney disease, will continue to increase the number of patients requiring transplantation in the coming years. This reality requires continued innovation and strategic investment to ensure that donation and transplantation services remain responsive, equitable, and sustainable.

The next phase of HAYAT will focus on expanding donation opportunities and increasing transplantation capacity throughout the region. Particular emphasis will be

placed on strengthening donor identification pathways, optimizing donor management practices, expanding donation after circulatory death programs, enhancing living donation initiatives, and increasing the number of healthcare institutions actively participating in the national ecosystem.

Workforce development will remain a strategic priority. Continued investment in donor coordinators, critical care professionals, transplant specialists, laboratory experts, and healthcare leaders will ensure that the UAE maintains the expertise necessary to support future growth. Professional development programs, certification pathways, international fellowships, and leadership training initiatives will further strengthen national capabilities.

The future evolution of HAYAT will also be supported by advanced information management, artificial intelligence, predictive analytics, and clinical decision-support tools. These capabilities will enhance donor identification, optimize resource utilization, support allocation decisions, strengthen quality assurance, and improve operational performance across the transplantation continuum. Importantly, technology will continue to serve as an enabler of system integration rather than an objective in itself.

Research, innovation, and implementation science will become increasingly important components of the program. HAYAT seeks to position the UAE as a regional and international model of excellence in donation and transplantation medicine by generating evidence, evaluating innovative practices, and contributing to global knowledge in organ donation and transplantation. Future research initiatives will focus on donor optimization, transplantation outcomes, quality of life, healthcare system performance, donation after circulatory death, artificial intelligence applications, and innovative strategies to increase donation rates.

International collaboration will continue to play a central role in the program's development. Strategic partnerships with leading transplantation organizations, academic institutions, and healthcare systems will facilitate knowledge exchange, benchmarking, research collaboration, and adoption of best practices. These partnerships will further strengthen the UAE's contribution to global transplantation efforts and support the development of innovative solutions to shared healthcare challenges.

The long-term vision of HAYAT extends beyond increasing transplantation activity. The program seeks to establish a globally recognized model for integrated organ donation and transplantation systems that can be adapted and replicated by other countries. By combining ethical governance, equitable access, clinical excellence, stakeholder integration, and sustainable healthcare practices, HAYAT demonstrates how national health systems can successfully address one of the most complex challenges in modern medicine.

Ultimately, HAYAT is not simply a donation and transplantation program. It is a national movement that transforms loss into hope, strengthens social solidarity, and demonstrates the capacity of healthcare innovation to save lives while advancing human dignity, compassion, and societal wellbeing.

Ethics

Ethics constitutes the foundation of the HAYAT Program and guides every aspect of organ donation and transplantation activities. The program was designed in accordance with the principles established by the World Health Organization,

international transplantation societies, and national legislation to ensure respect for human dignity, transparency, equity, accountability, and public trust.

A fundamental ethical principle of HAYAT is the equitable allocation of organs based exclusively on medical need, urgency, and compatibility. The system guarantees that transplantation opportunities are provided without discrimination based on nationality, religion, ethnicity, gender, social status, or financial capacity. This commitment to fairness has been instrumental in strengthening public confidence and ensuring equal access to life-saving healthcare services.

Respect for autonomy and informed decision-making is another core principle. Individuals are provided with the opportunity to voluntarily express their wishes regarding organ donation, while families receive comprehensive information, emotional support, and appropriate guidance throughout the donation process. All decisions are made without coercion and with full respect for cultural, religious, and personal values.

The program operates under a robust governance and oversight framework that ensures transparency, accountability, and ethical conduct throughout the transplantation pathway. Clear separation exists between end-of-life care, determination of death, donor evaluation, organ allocation, and transplantation activities, thereby preventing conflicts of interest and preserving public trust.

The protection of donor and recipient rights remains a priority. Strict safeguards ensure confidentiality, privacy, data protection, and respectful treatment of all individuals involved in the donation and transplantation process. Comprehensive regulations prohibit organ trafficking, commercialization, coercion, and exploitation, reinforcing the UAE's commitment to ethical transplantation practices.

Through the integration of fairness, transparency, accountability, and respect for human dignity, HAYAT has established a transplantation system that not only saves lives but also serves as a model of ethical healthcare practice and responsible governance.

Acknowledgements

The success of the HAYAT Program reflects the collective commitment of government institutions, healthcare organizations, healthcare professionals, community partners, and international collaborators who contributed to building the UAE's national organ donation and transplantation ecosystem.

We extend our sincere appreciation to the Ministry of Health and Prevention for its leadership, strategic vision, governance, and unwavering commitment to advancing organ donation and transplantation as a national healthcare priority.

We acknowledge the invaluable collaboration of the Department of Health – Abu Dhabi, Dubai Health Authority, Emirates Health Services, donor hospitals, transplant centers, laboratories, healthcare professionals, donor coordinators, and multidisciplinary clinical teams whose dedication has transformed transplantation services throughout the country.

We also recognize the contributions of national committees, regulatory authorities, academic institutions, charitable organizations, media partners, community leaders, and religious scholars who played a critical role in fostering public trust, increasing awareness, and promoting a culture of donation.

Special appreciation is extended to our international partners whose expertise, collaboration, and knowledge exchange have supported capacity building, benchmarking, and the continuous advancement of national transplantation practices.

Most importantly, we honor organ donors and their families. Their generosity, compassion, and extraordinary decision to give the gift of life have made every achievement of the program possible. Their legacy continues to inspire hope and remains at the heart of HAYAT's mission.

Layperson's Summary

HAYAT is the United Arab Emirates' national program for organ and tissue donation and transplantation. It was created to give hope to patients suffering from organ failure and to ensure that more people have access to life-saving transplant opportunities.

Before HAYAT, organ donation and transplantation activities were limited and often operated independently across different healthcare institutions. HAYAT transformed this approach by creating a nationally coordinated system that brings together hospitals, transplant centers, laboratories, healthcare professionals, and health authorities within a single framework dedicated to saving lives.

The program helps identify potential organ donors, supports families during the donation process, coordinates organ allocation, facilitates transplantation procedures, and monitors patient outcomes. By ensuring that all stakeholders work together, HAYAT improves efficiency, transparency, patient safety, and access to transplantation services.

HAYAT also encourages residents to register their willingness to become organ donors and promotes awareness about the importance of organ donation through education, community engagement, and public outreach initiatives. These efforts have helped increase public understanding and foster a culture of generosity and solidarity throughout society.

The impact of the program has been remarkable. Thousands of patients have received life-saving transplants, donor registrations have increased substantially, and the UAE has become one of the fastest-growing countries in the field of organ donation and transplantation.

The program is built upon principles of fairness, transparency, and compassion. Organs are allocated according to medical need, ensuring equal access to transplantation services for all eligible patients regardless of nationality, religion, gender, or social background.

More than a healthcare initiative, HAYAT is a humanitarian movement that transforms loss into hope. By bringing together healthcare expertise, public participation, and national collaboration, the program continues to save lives, improve quality of life, and strengthen the values of compassion, solidarity, and human dignity throughout the United Arab Emirates.

Innovation and originality - 30%

/ 5.00

5 being the highest and 1 as the lowest. * The submission demonstrates a high level of innovation in healthcare. * It provides a novel approach or solution to an existing challenge. * The project disrupts traditional approaches or solutions in healthcare or introduces a paradigm shift in addressing healthcare challenges.

Impact on healthcare - 30%

/ 5.00

5 being the highest and 1 as the lowest. * The submission should demonstrate positive outcomes with a potential to make a significant impact. * It addresses and provides solutions to an existing issue/need. * The project benefits to patients, healthcare providers, or the healthcare system are well documented.

Feasibility and implementation - 20%

/ 5.00

5 being the highest and 1 as the lowest. * The submission discusses the practicality and feasibility of implementing the project. * It demonstrates an effective process for implementation. * It considers barriers and solutions for successful adoption.

Quality of the presentation - 10%

/ 5.00

5 being the highest and 1 as the lowest. * The data presented is well organized, clear, and concise. * Visual aids (if presented) enhance the understanding of the project. * The writing is professional.

Ethical consideration - 10%

/ 5.00

5 being the highest and 1 as the lowest. * The submission addresses ethical concerns related to the project. * It addresses patient privacy and data security concerns. * Ethical considerations are well integrated into the innovation design.
