Project Title

From Vision to Reality: Building a Burn Center of Excellence in the UAE

Project Brief

> This project outlines the transformative journey of establishing Abu Dhabi's first Burn Center of Excellence, driven by a bold vision to achieve American Burn Association (ABA) accreditation and national recognition. Responding to a critical healthcare need, we pioneered the re-definition of a multidisciplinary, innovation-driven model for specialized burn care in the UAE/region, setting new benchmarks in burn clinical quality and education and initiation of regional burn research.
>
> Innovation was woven into every stage of development. Our team pioneered a fully integrated, multidisciplinary care model, merging cutting-edge temporary skin substitutes, development customized clinical pathways aligned with ABA standards, specialised rehabilitation to deliver personalized, outcomes-focused treatment and re-imbursement/charitable pathways to facilitate the long term care required for burn survivors. We reengineered traditional clinical pathways, introducing real-time quality dashboards to optimize decision-making and elevate standards of burn care.
>
> We reimagined traditional staffing models by building a dynamic, cross-trained workforce capable of delivering high-acuity burn care, intensive rehabilitation, and psychosocial support under one roof. Through international collaborations, we introduced innovative education programs and simulation-based training tailored specifically for the unique challenges of burn injuries.
>
> The project also collaborated on novel national systems — establishing the Abu Dhabi's first coordinated burn referral network, revolutionizing emergency response protocols, and launching culturally tailored burn prevention campaigns and survivor programs that set a new benchmark for public health and re-integration innovation.
>
> Pursuing ABA accreditation demands not just compliance, but the creation of a resilient, data-driven ecosystem committed to excellence. Rigorous internal audits, strategic mock verifications, and iterative quality improvements ensuring that the Burn Center is not merely ready for evaluation — it is designed to lead.
>
> Beyond clinical care, we envision a center of research and innovation, initiating the UAE's first dedicated burn research program to explore advanced wound therapies, tissue engineering, and patient-reported outcomes.
>
> "From Vision to Reality" is a story of transforming ambition into achievement, setting a national and regional precedent for what burn care innovation can accomplish. This

initiative positions Abu Dhabi, and the UAE, as regional leaders in the future of comprehensive burn management.

Background

Burn injuries represented a significant yet often under-recognized public health challenge in the UAE and across the Middle East. High rates of industrialization, increased urbanization, and the presence of large expatriate populations working in high-risk industries contribute to a steady incidence of complex burn injuries.

Despite the existence of various burn treatment units, there remained a critical gap in providing comprehensive, multidisciplinary, high-acuity care that meets international best practice standards.

Currently, no center in the region holds American Burn Association (ABA) Level 1 Verification — the gold standard for burn care excellence. Without such a facility, patients suffering from severe burns faced fragmented care pathways, delayed specialist interventions, variable rehabilitation access, and limited psychosocial support. These gaps directly impact survival rates, long-term functional outcomes, and overall quality of life for burn survivors.

An internationally accredited Level 1 Burn Center would address these urgent needs by delivering coordinated, evidence-based care across the entire continuum — from resuscitation and acute management to rehabilitation and reintegration. It would also serve as a critical resource for disaster preparedness, given the region's vulnerability to industrial accidents and mass casualty events involving burns.

Moreover, the establishment of a Level 1 Center would drive education, research, and workforce development, elevating standards of burn care locally and reducing the need for patients to seek treatment abroad. It would foster innovation in wound healing, scar prevention, and burn prevention programs tailored to the regional context.

For the UAE — a global leader in healthcare ambition — the development of an internationally accredited Burn Center is both a national necessity and an opportunity: to set new benchmarks in specialized care, to lead the region in clinical excellence, and to advance the science and humanity of burn care on the world stage.

Objective

1. Establish an Abu Dhabi, Department of Health, Burns Center of Excellence that is an American Burn Association (ABA) -verified to provide comprehensive, high-quality care for burn injuries in alignment with international standards.
2. Develop a multidisciplinary clinical standard and administrative framework to support ABA verification, including specialized staffing, infrastructure, protocols, technology, supplies and data systems.
3. Enhance capacity for specialized burn care within the UAE military health system through targeted training, partnerships, and infrastructure development.
4. Lay the groundwork for a future National Burn Center serving both military and civilian populations, advancing research, education, and regional burn care leadership.
5. Foster international collaboration and accreditation readiness by aligning policies, quality metrics, and performance improvement initiatives with ABA standards. In addition, participate in international association/society activity aimed at ongoing advancement of burn care.

Implementation

The need for the SSMC Burn Unit to become a Center of Excellence for Abu Dhabi and internationally verified was identified by the UAE Armed Forces in collaboration with Department of Health (DOH) Abu Dhabi - Center for Emergency Preparedness and Response (CEPAR). There was engagement of the American Department of Defense group - Trauma Burns Rehabilitation Medicine (TBRM) to support the transformation and enhancement of burn care at SSMC into a Centers of Excellence with international accreditation to provide the highest level of care, in the case of Burns, this is American Burns Association (ABA) Accreditation. The vision was to be enabled through these collaborations with Sheikh Shakhbout Medical City (SSMC). The focus on the Burn COE Project was largely initiated in January 2023 with a 3 year project plan (attached) focussed on the key areas:

Funding Model
Staffing
Facilities
Resources
Standard of Care
Follow Up and Re-integration
System
Center of Excellence and ABA Accreditation

As most key areas were implemented in tandem, below is a relative timeline account. A financial and economic analysis was completed to assess the viability of the project and evaluating the economic impacts. The Department of Health (CEPAR) approved the plan and the project was initiated.

Recruitment was prioritised and expedited for the addition of the first key 37 roles including dedicated Burn Surgeons and a Program Manager. The first dedicated Burn Surgeon and Program manager arrived in October 2023. Once critical staffing levels were reached, an additional 5 beds were opened in January 2024. In 2024 a further 38 staff were approved and expedited to expand the MDT to include important roles to meet the ABA Standards including additions to critical clinical teams, a dedicated psychosocial team and clinical data registrars to enable a registry.

Burn Care Management Standards were drafted in collaboration with the Department of Health (DOH) to outline the structure of burn care management across the emirate, the criteria for admissions to burn centers or units, the standard of burn care required at burn centers and units. DOH CEPAR set up special pathway taskforces to facilitate the Trauma and Burns system requirements of which the Burn center participates in the following:

- Trauma, Rehabilitation & Survivorship
  As part of a Center of Excellence (COE) requirement, an Abu Dhabi Burn Council was set up in September 2024, which the SSMC Burn Center chairs bi-monthly with the purpose of acting as a steering body for Burn Service Provision across Abu Dhabi.

A Burn Program Management Team lead by the Burn Center Director and Burn Program Manager was created and a Performance Improvement Plan laying out the process to monitor care proactively for adherence to guidelines and to review deaths and complications for opportunities for improvement was developed and integrated into the hospital quality system and implemented. All deaths and at least 5 significant

complications annually are required to have full hospital level multidisciplinary review and action plans implemented for opportunities for improvement loop closure. Review committees have liaison involvement from Critical Care (Adult and Paediatrics), Anaesthesia, Emergency Medicine, Trauma and Infectious Diseases.

A self-made data collection minimal excel version of a registry was implemented in 2023 & 2024 that allowed for some data collection and analysis. The 1st registrar joined in late 2024. An international Burn Care Quality Platform compliant registry was sought and approved. Initial implementation is currently in progress with training and the aim to go live on 30th June 2025.

26 policies, guidelines and protocols were identified and worked on to support most up to date evidence-based care in line with the ABA and DOH Standards. 6 standardised order sets were created to facilitate adherence to the guidelines.

Standard of care was elevated by a number of targeted projects with the development of their guiding documents. A co-ordination of care policy was developed and implemented to ensure efficient and comprehensive coordination of care for patients with burn injuries. This policy outlines the responsibilities of healthcare providers involved in the care of burn patients and establishes guidelines for communication, collaboration, escalation and continuity of care in all point of care environments eg Emergency Department, Operating Room, Burns ICU/PICU, Burns ward level and Burns Surgery Clinic. In addition, twice weekly multi-disciplinary meetings were implemented with representation from the entire team disciplines. Patient and family educational materials for all aspects of burn care were developed in English, Arabic and Hindi.

Surgical approach was changed from staged excision and autografting as per available skin to autograft, to early near total burn wound excision within 48hours (Oct 2023) and use of temporary skin substitutes (human allograft (Jan 2024) and biodegradable temporising matrix (BTM) (Jul 2023) prior to readiness for autografting where necessary.

Facilities supported our requirement for the temperature in the rooms to be increased to 32 degrees C and the dedicated burn theatre to be kept at 27 degrees to minimise the complications associated with hypothermia during surgeries and dressing changes. Supply chain/procurement was instrumental in sourcing the key equipment/technology and consumables identified by the team to enable the Standard of Care required changes.

A dedicated dressing team approach was implemented in March 2023 where a change was made from an approach where the assigned nurse with nurses borrowed from other patients provided the dressing changes, leaving other patients to be cared for high patient to nurse ratios, to a system where there is a team of 3-5 nurses dedicated to dressing changes for all patients requiring dressing changes.

Volume based feeding (as opposed to rate-based feeding), addition of micronutrients monitoring and management and a change in NPO protocols whereby NPO times are reduced with the allowance of clear fluid carbohydrate drinks from 6-2hrs prior to procedures for non-secured airway patients and no NPO time for those with secure airways was created and implemented. In addition the use of anabolic steroids for male patients with >30% total body surface areas was started.

Clinical pharmacy attended daily rounds and our Infectious Diseases liaison team attended rounds once a week lead stringent antibiotic stewardship.

A dedicated Burns Rehabilitation Coordinator for all dedicated physical and psychosocial allied helath team members was established to ensure holistic and co-ordinated allied health plan of care. Early mobilisation of ICU level patients and early mobilisation post graft protocols were created and implemented along with illustrated splinting and positioning guidelines available in the patient rooms.

An Outpatient Clinic was designed and built on the same floor to facilitate the holistic follow up of burn survivors by the same dedicated team and opened in August 2024. An application for charitable coverage of follow up care including pressure garments, rehabilitation, re-integration and reconstructive care often not covered by insurance was made.

A Burn Survivor Program was initiated in 2025 to bring together Burn Survivors in a safe and comfortable environment in which they can share their story and experiences, hope, acceptance, and resilience as well as validate a shared experience of surviving a burn injury and gain life skills.

A Professional Education and Outreach Program was initiated to include:

- residents and students
- observership/work experience opportunities
- a monthly DOH accredited CME program
- workshops for our rehabilitation partners
- hosting international burns courses
- educational letters to transferring facilities regarding opportunities for improvement
- Applied (Feb 2025) to set up an Emirates Burn Society under the auspices of Emirates Medical Association to enhance the reach of
  A Community Prevention and Awareness program was initiated in December 2023 with the development of prevention and first aid educational materials.

Burn Mass Casualty Preparedness is ongoing:
-System capacity / capability reviews with other burn care providers initiated in February 2025

- Failure Mode effect analysis (FMEA) completed within SSMC, as we are the Burn Center - February 2025
- Drills are planned and being conducted
- Burn Specific Action Cards and Surge plans are being worked on

Barriers/challenges and Solutions:

- Re-imbursement model that can account for the cost of international best practice care including temporary skin substitutes is a challenge and work is ongoing with the DOH payor sector to establish a coding and DRG that can sustainably cover the costs of care.
  - Sourcing equipment and skin substitutes has been challenging as the volumes are relatively small and the needs are highly specialised, but we have been able to source the requirements with support from the international network.
  - Changing regulations eg for burn operating room temperature was challenging, but with evidence-based justifications and international examples, we were able to achieve this.

- Adding burn specific skills to generalised scopes of practice was a challenge and required submission of examples internationally and the training/ competence requirements to support the change.
- Financial coverage of pressure garments and follow up especially psychosocial and re-integration as this is not covered by most insurances. We applied for a Ma'an charity account.
- Creating a mould and breaking down barriers for survivorship and re-integration programs that are not common in the UAE is a current challenge and we are moving forward trying to get as much feedback from survivors as possible to analyse and support a way forward for a culturally sensitive program.

Result

2023:
Early 2023: Established funding model and project plan with CEPAR, DOH
March: Burn Nurse Dressing team
June: Burn Nutrition / NPO Guidelines
July: Biodegradable Temporizing Matrix available for temporary cover
August: Burns and Plastic Services separate
October: 1st dedicated Burn Surgeon started & early near total burn excision and cover was initiated (change from previous conservative approach)
Burn Program Manager started and Burn Program Management initiated
December: Hosted international Interburns Advanced Burn Care - Nursing course (5 days, 25 participants)

2024:
January: Second dedicated Burn Surgeon started
Cryopreserved allograft available and implemented
Additional 5 beds opened - 20 ICU capable beds
Monthly burns specific, DOH accredited CME provision started and is now attended by personnel from 8 different entities
March: Center of Excellence assessment by subject matter expert from ABA
May: Third Burn Surgeon started and some reconstructive surgery started
June: DOH Burn Specific JAWDA KPIs implemented
Hosted international Interburns Advanced Burn Care - Surgery course (5 days, 23 participants)
August: Outpatient Burn Surgery Clinic opened
September: Department of Health, Center of Excellence status achieved
Department of Health, Burn Care Management Standards published - supporting Burn System National Burn Center, Center and Unit structure
1st Burn Council meeting - shared standards & referral criteria
Patient & family education materials available in Arabic, English and Hindi
December: 2023 vs 2024 Outcomes
Admissions: 39% increase in acute burn injury admissions (273 to 366) and 44% increase in total admissions (273 to 393) to the burn service
Inpatient daily census: Increased from 12.08 to 15.77 (31%)
Burns admitted to ICU (>20% Total Body Surface Area): 71 in both years, but acuity was higher in 2024 with 27 (v17) with inhalation injury and 44 (vs 34) with an R-Baux score of >80. R-BAUX Scoring predicts mortality based on the sum of the Total Body Surface Area Burnt, age and presence or absence of an inhalation injury. For a burn population, a BAUX (TBSA and Age only) score of >80 in low- and middle-income countries (100-110 in high income countries) is associated with ~50% mortality rate.
All JAWDA Burn specific KPI's within targets (internationally benchmarked)

Crude Mortality dropped from 5.7% to 3.3%.
87% of patients discharged home directly from the Burn Center
Repatriated >18 patients to 6 different countries with direct handover of ongoing care to burn physicians in their home countries with the support of Interburns network.
2025:
February: Visit from Sheikh Tahnoon Medical City (STMC), Al Ain, who is developing a burn unit and experience, guiding documents, equipment and consumables lists shared
Hosted the set up of Australia & New Zealand Burns Association, Emergency management of Severe Burns Course in UAE (71 participants at provider courses and 10 for the instructor course and 9 successful instructors)
March: Commission on Accreditation for rehabilitation facilities (CARF) Accreditation achieved for inpatient and outpatient rehabilitation for a 3 year period.
April: April 2024 (53 seen) vs April 2025 (237seen) shows a 347% increase in outpatient follow up volumes
Ma'an charity account approved to facilitate burn survivor post-acute care
Approval to set up Emirates Burn Special Interest Group under the supervision of Emirates Medical Association - Emirates Plastic Surgery Society
1st Burn Survivor group meeting held
Two abstracts submitted for the European Burns Association meeting to be held in September 2025
May: Implementation of an international BCQP compliant registry

Currently 17/26 (65%) of burn specific guiding documents are published and implemented with remaining in progress, but practices being implemented. Care is well co-ordinated in all points of care environments with clear lines of responsibility and the MDT meetings have lead to decreased interruptions on rounds, improved communication among team members and improved efficacy and efficiency of care.

Dressing change practice change resulted in:
-Average 3 dressings per day (all sedated): average 5-8 dressing changes per day with a max of 10 that can be accommodated if required (sedated only if indicated)
-Significantly shorter dressing change times
-Dressing changes approximately 3-5 days apart: Dressings can be daily and on average every 2-3 days

Significant improvements noted in minimising calorie deficits were noted in addition to minimising the incidence of patients losing >10% of their body weight and requiring total parenteral nutrition.

Improved antibiotic stewardship lead to fewer multi-drug resistant infections ,reduced usage of broad spectrum antibiotics and cost of antibiotic usage.

Early and dedicated rehabilitation has lead to reduced complications such as contractures, heterotopic ossification and helped to ensure LOS for approx. 1 day/% TBSA burn.

6 community awareness and prevention events have been conducted since December 2023 reaching approximately 700 persons with take away educational materials provided.

Discussion and future directive

Shaping the Future of Burn Care: Strategic Directives for a Regional Center of Excellence

As the burden of burn injuries continues to challenge healthcare systems globally, the development of a high-performing, future-ready Burn Center is essential to meet the needs of patients, healthcare providers, and the broader public health ecosystem. With a strong foundation already in place, our Burn Center is poised to expand its scope and impact across the UAE and the wider GCC region. The following strategic initiatives represent our vision for the future — grounded in clinical excellence, data-driven quality improvement, international collaboration, and sustainable growth.

1. BCQP-Compliant Registry: Completing One Year of Accurate Data Collection (From July 2025)
   The cornerstone of continuous quality improvement in burn care is robust, standardized data. By July 2025, the Burn Center will complete its first full year of compliance with the Burn Care Quality Platform (BCQP), ensuring accurate, consistent registry data across patient outcomes, clinical interventions, and system performance. This achievement will allow for comprehensive benchmarking against international burn care standards and will serve as a foundational requirement for future accreditation and verification efforts. Regular audits and staff training in data entry will ensure the reliability of the registry, fostering a culture of transparency and accountability.

2. Regional and International Burn Symposium – November 1, 2025
   To further position the Burn Center as a hub of innovation and collaboration, we will host a Regional and International Burns Symposium on November 1, 2025. This event will gather burn care experts, surgeons, rehabilitation specialists, researchers, and policy-makers from across the globe to exchange best practices and promote regional alignment in burn care strategies. The symposium will serve as a platform to showcase our clinical capabilities, research output, and innovations in reconstructive care, while also encouraging knowledge transfer and capacity-building in neighboring countries.

3. Expansion of Bed Capacity and Infrastructure
   In response to increasing demand, we are initiating the expansion of our inpatient capacity from 20 to 30 beds. This will include a dedicated shower and dressing change room, designed to optimize hygiene, reduce infection risk, and improve patient comfort during wound care. Additionally, we will introduce a burn-specific activity and rehabilitation room to enhance physical and psychological recovery. These infrastructure enhancements reflect our commitment to delivering holistic and patient-centered care throughout the treatment continuum.

4. In-House Pressure Garment Production
   To improve turnaround times and ensure garment accuracy and fit, the Burn Center will implement an in-house pressure garment production unit. Pressure garments are essential in managing hypertrophic scarring and supporting long-term rehabilitation. By producing these garments on-site, we can offer more timely fittings, customization, and adjustments, significantly improving patient outcomes and satisfaction. This initiative will also offer cost savings and allow for innovation in materials and designs based on patient needs.

5. Attaining American Burn Association (ABA) Verification – Target: Second Half of 2026
   Our medium-term goal is to secure American Burn Association (ABA) Verification by the second half of 2026. This rigorous process involves

demonstrating excellence across all domains of burn care: emergency response, surgical and non-surgical treatment, rehabilitation, staff competencies, and outcomes measurement. ABA verification will elevate the Burn Center's credibility, align us with leading global institutions, and support regional referrals. Preparatory steps include optimizing multidisciplinary pathways, refining documentation practices, enhancing staff training, and ensuring compliance with ABA criteria.

6. Establishing a National and Regional Role
   With expanded capacity, high-quality outcomes, and ABA verification underway, the Burn Center will pursue formal designation as the National Burn Center for the United Arab Emirates. Given its scale and strategic alignment with UAE health policy, the Center could also evolve into a regional referral hub for the GCC, promoting regional harmonization in burn care and enhancing emergency preparedness. A phased approach to formal designation will include engagement with national authorities, review of policy frameworks, and cross-border partnerships with health institutions.

7. Comprehensive Reconstructive Package and Medical Tourism
   As part of our advanced services, we will offer a full spectrum surgical and non-surgical reconstructive package for burn survivors. This includes laser therapy, fat grafting, contracture release, aesthetic and functional reconstructions, and psychological support. By integrating this package into a medical tourism offering, the Burn Center can attract international patients seeking world-class care at competitive rates. This not only positions the UAE as a destination for specialized medicine but also provides a sustainable revenue stream that can be reinvested into public care services.

8. Completion of Abu Dhabi and National Burn Mass Casualty Response Plan
   To ensure preparedness for large-scale emergencies, the Burn Center is participating in the development of a comprehensive Burn Mass Casualty Response Plan for Abu Dhabi, with potential expansion to a National-level framework. This plan encompasses triage protocols, surge capacity modeling, inter-facility coordination, workforce mobilization, logistics planning, and drills. Integration with national civil defense and emergency medical services will be critical, and scenario-based exercises will be scheduled annually. This initiative is essential not only for disaster readiness but also to meet ABA verification standards.

9. Creating a Sustainable Burn Care Reimbursement Model
   High-quality burn care is resource-intensive. To ensure long-term sustainability, the Burn Center aims to develop a reimbursement model that balances clinical complexity with financial viability. This model will include negotiations with payers for bundled payments, DRG coding optimization, and cost-effectiveness analysis of burn interventions. Special consideration will be given to uninsured patients, with proposals to create a hybrid public-private subsidy system or a philanthropy-backed fund for essential, life-saving burn care. The model will aim to protect equity of access while ensuring operational sustainability.

10. Exploring a National Skin Bank
    Lastly, the Burn Center will explore the creation of a national skin bank, a critical step in strengthening the country's emergency response capacity and improving survival outcomes in severe burns. A feasibility study will assess infrastructure requirements, ethical and regulatory considerations, donor

recruitment strategies, and integration with surgical protocols. The skin bank would provide allografts for acute burn management and mass casualty events, reduce reliance on external suppliers, and enable research into skin preservation and bioengineering.

Ethics

Ethical Considerations:

The Burn Center of Excellence prioritizes culturally sensitive, patient-centered care by ensuring communication in patients' preferred languages using multilingual staff, live translation, and educational materials in Arabic, English, and Hindi.

Equitable access is central, with acute care available to all, including uninsured patients attending the emergency department. For transfers in, access aligns with UAE's healthcare coverage policies and laws. Advocacy to include all patients with burns continues. A Ma'an charity account is approved and being activated to support long-term burn care, enabling vital pressure garments anf follow-up for underserved patients.

Geographically, services extend across Abu Dhabi and are accessible nationwide via a dedicated transfer and assessment center. Clinical standards are adapted from the American Burn Association (ABA), integrated with UAE-specific guidelines and cultural practices. A fellowship program is being developed to support local workforce training.

The center upholds ethical research and burn data registry practices with informed consent, IRB approval, and data privacy measures aligned with UAE law and international standards.

End-of-life and pain management decisions are guided by ethical and legal frameworks, balancing aggressive intervention with UAE laws on allowing natural death and Do Not Resuscitate (DNR).

Acknowledgements

Our sincere gratitude to the Department of Health, Abu Dhabi through the Center of Emergency Preparedness (CEPAR), who have been the sponsors and collaborative partners of this project with SSMC to enable this vision to become a reality.

Thanks also to Department of Heath, Center of Excellence (COE) for setting the COE standards and supporting our COE assessment and continuing journey to ongoing excellence.

To the UAE Armed Forces and their American Department of Defense Team - Trauma Burn Rehabilitation Medicine (TBRM) - thank you for seeing SSMC burn unit potential to achieve the vision and working alongside us to enable the realisation of the vision.

Lastly but certainly not least, our SSMC executive leadership, all interconnected departments at SSMC and the Burn Center Team, without which this would not have been made a reality.

Layperson's Summary

Establishing a Burn Centre of Excellence in Abu Dhabi, UAE

Burn injuries are among the most complex and life-changing medical emergencies, requiring highly specialized care. Until now, the UAE has not had a fully accredited center dedicated to providing the highest international standard of burn care. This innovation project aims to change that by establishing a Burn Centre of Excellence in Abu Dhabi, accredited by the American Burn Association (ABA)—the global gold standard in burn treatment.

The need for this project arose from a growing number of burn patients in the UAE and wider region who often face long recovery journeys and limited access to comprehensive care. The Center offers advanced surgical and non-surgical treatments, specialized rehabilitation, and long-term support, ensuring better outcomes and quality of life for survivors.

The project's objectives include creating a purpose-built facility with highly trained teams, integrating international best practices, and building a national burn injury registry. Implementation involves infrastructure development, staff education, community outreach, and alignment with ABA verification standards. Strong collaboration with local and international experts ensures a safe, sustainable, and patient-centered model of care.

Early outcomes include improved patient recovery times, a reduction in complications, and increased public awareness of burn prevention and treatment. Over time, the Center aims to serve not only the UAE but potentially the entire GCC region, while offering medical tourism packages and serving as a training hub.

Ethically, the project prioritizes equal access to care, regardless of insurance status, and emphasizes respect, cultural sensitivity, and long-term psychosocial support for burn survivors. By combining compassion, science, and innovation, the Burn Centre of Excellence aims to transform the future of burn care in the region.

Innovation and originality - 30%

/ 5.00

5 being the highest and 1 as the lowest. * The submission demonstrates a high level of innovation in healthcare. * It provides a novel approach or solution to an existing challenge. * The project disrupts traditional approaches or solutions in healthcare or introduces a paradigm shift in addressing healthcare challenges.

Impact on healthcare - 30%

/ 5.00

5 being the highest and 1 as the lowest. * The submission should demonstrate positive outcomes with a potential to make a significant impact. * It addresses and provides solutions to an existing issue/need. * The project benefits to patients, healthcare providers, or the healthcare system are well documented.

Feasibility and implementation - 20%

/ 5.00

5 being the highest and 1 as the lowest. * The submission discusses the practicality and feasibility of implementing the project. * It demonstrates an effective process for implementation. * It considers barriers and solutions for successful adoption.

Quality of the presentation - 10%

/ 5.00

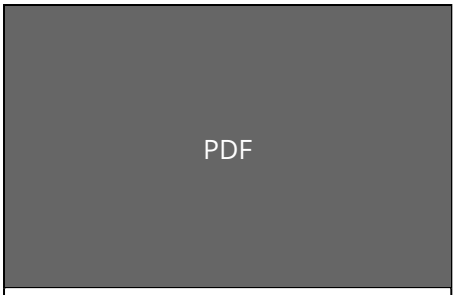

5 being the highest and 1 as the lowest. * The data presented is well organized, clear, and concise. * Visual aids (if presented) enhance the understanding of the project. * The writing is professional.

Ethical consideration - 10%

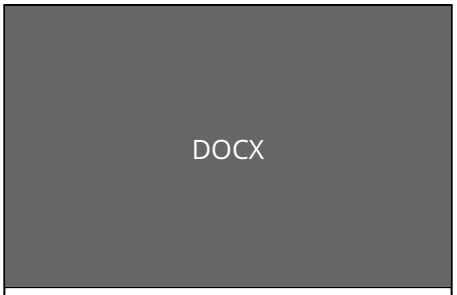

/ 5.00

5 being the highest and 1 as the lowest. * The submission addresses ethical concerns related to the project. * It addresses patient privacy and data security concerns. * Ethical considerations are well integrated into the innovation design.
